

Reparation of German Self-esteem

Bernhard Bierschenk

Abstract Marion Gräfin Dönhoff was a German journalist and publisher, who wrote in 1951 at the fifth birthday of the National Weekly Newspaper *Die Zeit* a deviant confession. The study of her declaration is based on the Agent-action-Objective (AaO) axiom which assumes the structural stability of the Objective (O) and the morphogenesis of the Agent (A). But this requirement can be satisfied only under the condition that a certain kind of writing can be identified which means that the nature of writing becomes approachable. Getting the A- component under experimental control, means that lawful relations can be included in laws that are governing text patterning. It will be demonstrated that angular articulations are characterising dynamical text movements. Resulting from Dönhoff's text production are convoluted structures, which are shown to reflect transformations on the meaning of topological invariants. However, independent of their textually embedded magnitudes, they cannot survive. Thus a passionate critic of the Nürnberg processes by Dönhoff has been made the starting point in studying the spaces of the (A) and (O) component of the paragraph, reproduced in *Die Zeit* (2021, No. 19). The spaces restrict text movements in certain ways. Over the given textual environments, it has been possible to demonstrate that uniqueness can be achieved within the context of the presented text analysis.

Es war ein trotziges Bekenntnis, das sich Die ZEIT zu ihrem fünften Geburtstag 1951 ins Stammbuch schrieb: "Deutsch zu sein, galt nicht viel nach dem verlorenen Kriege [...]. Wir beschlossen, als wir 'Die Zeit' gründeten: deutsch zu sein." Mochten die Westmächte sich auch zum Richter über das Tätervolk aufschwingen, es strafen und umerziehen – die Hamburger Wochenzeitung segelte auf Gegenkurs: Sprach sie von den Deutschen, meinte sie die Schicksalsgemeinschaft der Unschuldigen, die im Nationalsozialismus verführt worden waren und die nun, kaum erträglicher, in die Fänge der "Siegerjustiz" gerieten. "Die Welt verlangt von uns: Bekenne, wir sagen: Nein", hielt Richard Tüngel, Chefredakteur von 1946 bis 1955, den Siegermächten in der ZEIT entgegen (Die Zeit. 2021, 19).

The text of the paragraph to be analysed is presented in italics and has been subjected to *Perspective Text Analysis (PTA)*: As scientific method in the true sense of the notion science, the Vertex version of PTA (Bierschenk. I. & Bierschenk, B. 2011, 2014) represents a novel approach to text-based studies. The applied Pertex/Vertex analysis procedures are based on the Kantian (AaO) axiom. The aim with the PTA procedures is to unfold the fusion dynamics of Agent and Objective and to explain the evolving attractors in the Free Energy Surfaces (FES) of Objective and

2 Reparation of German Self-esteem

the Agent. For the Objective they are reproduced in Figure 1 and for the Agent in Figure 2. As demonstrated, FES consists in the beginning of nothing but a geometric pattern of mountains and valleys, i.e. the abstract configuration of fusion attractors. However, if it shall be possible to orientate oneself in an energy landscape, the landscape must become (1) symbolic and (2) possible to be transited by means of a transformation path. The resulting path needs to become augmented and manifested in the form of termini. Since a terminus is the result of a transformation process, it incorporates both the state as well as the dependency relation between termini. A detailed description of the transformation steps involved in a sequence of attractors allows for a thoroughly controlled naming process. Further, terminologically the operation becomes distinguishable and controlled by state-changes which are expected to lead to the correct communication of symbolically significant information invariants.

In a most fundamental sense, addressing the fusion dynamics in the Dönhoff paragraph constitutes a novel approach to the study of its pattern dynamics. In an attempt to reformulate some operations in text dynamics, and angular displacement as well as the movement control of text elements, reference is made to the original sense of the Latin expression *vertex*. It means the displacement of something that is flowing and very time-dependent (B. Bierschenk, 1984). Characteristic of the early studies has been their concentration on the interplay of intentionality and orientation within the Agent-action-Objective (AaO) paradigm (B. Bierschenk, 1991, I. Bierschenk, 1999/2003). Therefore, developing a new formalism, based on cyclic energy investment and the expression of flow velocities, must be regarded as a major step toward the operationalisation of the AaO paradigm and its foundation as biophysical production mechanism.

Structural Stability in the Orientation Dimension

The transition through the fusion landscape of Figure 1 is strictly controlled by the underlying variable relations. Since the integration process exists only over time it is generating a fusion dynamics which is correcting itself. Repeated transformations and crossing of the path with others allows for the integration of the consequences of having found a proper function in the form of dynamic fusion relations. Thus, shifting experiences are provided during the designation which is expected to lead to an understanding of the meaning generated by the fusion process.

After World War II reparation of West Germany and West German Self-esteem was a long and laborious process during which people had suffered heavy losses in lives and have experienced intellectual reparations due to exploitation and plunder, first by the US and the UK and later by France. As a result of the "Morgenthau Plan" especially the US made an attempt to convert the whole country into a pastoral and agricultural nation. As a consequence, many factories were dismantled or simply converted into light industry.

Furthermore, millions of German prisoners of war worked for several years for both Western Allies and the Soviet Union. As soon as the

war ended in 1945, the Allied forces worked in the process of denazification on removing Nazi influences from Germany. By the success of this process and the beginning of the 'Cold War', Western Allied Forces had to reconsider their policy and consider the Germans as possible allies as well as to incorporate them in the economic reconstruction of Europe. By 1950, the UK and France were finally induced to follow the US and stop the dismantling of German heavy industry.

By following through Figure 1 step by step it will become obvious that there is an inbuilt and dynamic correction mechanism. Thus, by getting too far away from a suitable terminus, it becomes difficult to form a proper path and consequently to come up with a conclusive term in order to close an actual ring structure. The anchor of the structure becomes approachable by reporting the text surface relations. To get some feeling for the way in which the recommended procedure works, illustrations of the transformation process are given in Table A1 and become assessable by following the transformation path of the Objective strand.

Transformation begins with binding textual strings to the respective 'point attractor' (i.e., the edge value of the underlying mesh). This is the first step in the process. As illustrated, variable (1) of Table A1 connects to a dummy. Controlling the mesh representation continues with the variable relations which indicate that the strings are repeatedly bound to higher order abstractions which get their symbolic significance. By continuing with further terminal states it will become clear that the terminal strings connect to the states, which determine the nodes of the variables. A description of the termini through transformations applies to Figure 1.

4 Reparation of German Self-esteem

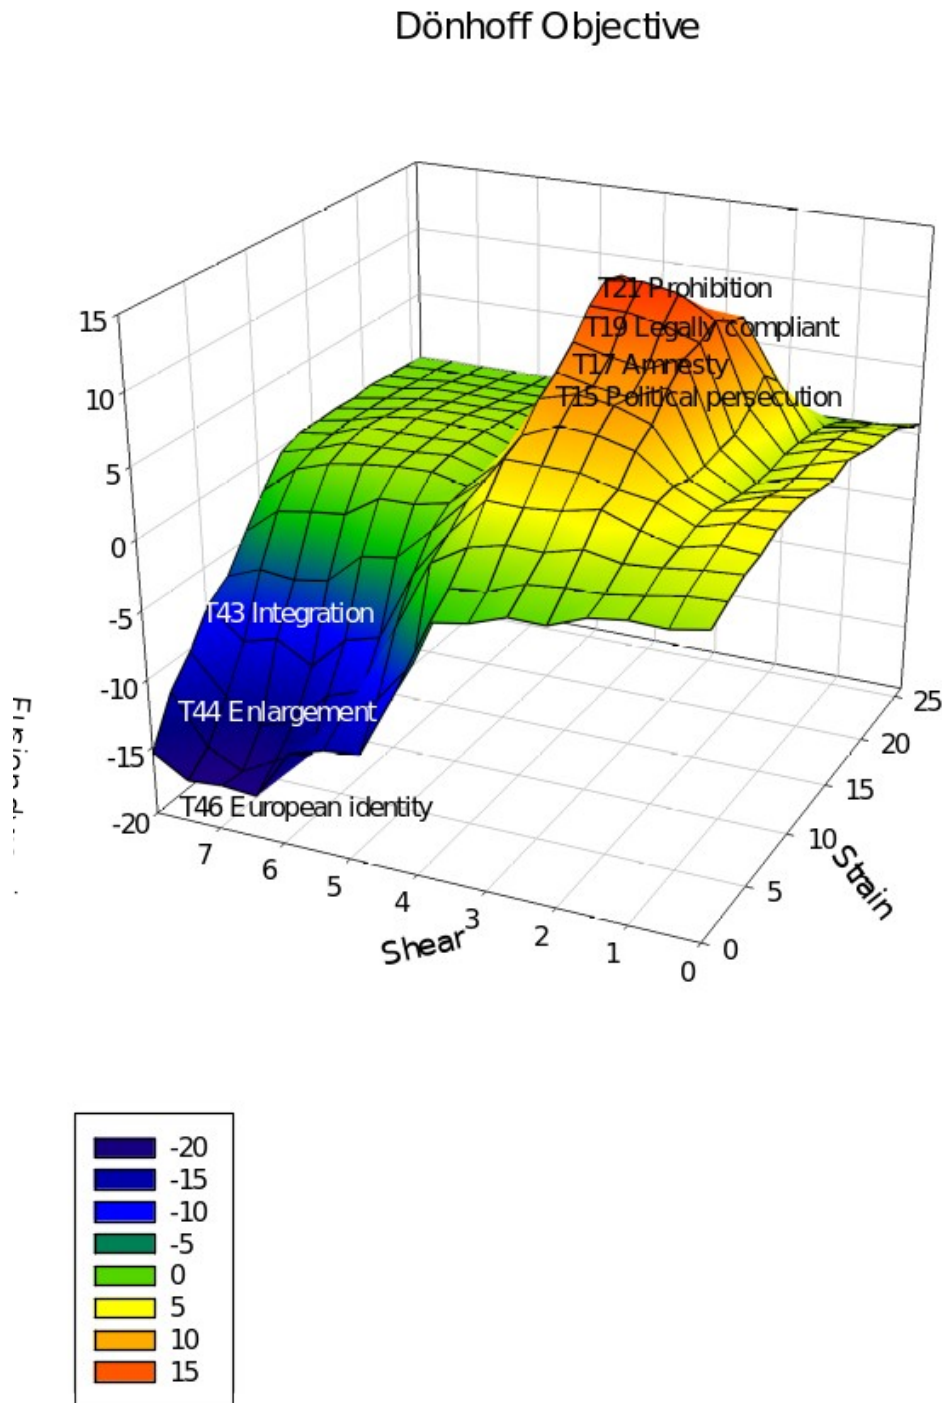

Figure 1 Objective graph derived from the Dönhoff paragraph in 'Die Zeit' of 1921, 19.

(T_{021}) Prohibition = 73.5364

On September 7th 1949, the Bundestag of the BRD met for the first time in Bonn. After decades of dictatorship, war and confusion, the Bundestag marked a new start for West Germany. Between 1945 and 1949, Germany was in disarray. After the end of WWII, the country found

itself divided between Allied and Soviet powers and Germany as a country was practically non-existent as a political entity. As the two sides, West and East Germany, struggled to cooperate on issues of denazification, demilitarization and reparation, it became increasingly unlikely that a unified German nation would emerge anytime soon. In 1949, two separate states, BRD and GRD emerged out of the rubble. The Allies controlled West Germany, and thus BRD which decided on Bonn as its capital city. After four years of post-war confusion and lack of identity, West Germany was beginning to get on track and onto its own feet. After reunification in 1990, the 12th Bundestag was the first all-German parliament to be voted in since the two states became one.

Furthermore, after WWII was lost in 1945, being a German did not count for much (Dönhoff, *Die Zeit*, 2021, 19). Especially in the perspective of the victorious powers, which became the promoters of the judges of the perpetrators, the Germans were required to endure a serious course of re-education and learning to practice democracy. This path grew from the Empire to the Weimar Republic and Nazi Dictatorship to the *Democratic Economic Miracle Land of the BRD*. This is the country which most of the post-war West Germans have learned to appreciate both emotionally and politically. The term 'Wirtschaftswunder' has been used to describe the rapid reconstruction and development of the post-war economy (Gethard, 2021). After the founding of the European Common Market in 1957, economic growth in West Germany was standing in contrast to the struggling conditions of the victorious powers, e.g. the United Kingdom and France.

(I₀₁₉) Legally compliant = 61.8618

Legally compliant refers to two parts, namely legal on one side and compliant on the other. Considered in the context of the BRD, the citizens were required to comply with the established West German "Grundgesetz" (constitution), rules and commands. In view of the Grundgesetz, legal has a broad meaning and includes national, provincial and local legislation. Behaving in accordance with the legal system refers to laws, rules or policies and therefore requires behaviour of the citizen that acknowledges the policy of the authority. The term "constitution" was actually avoided at that time because the Grundgesetz was regarded as an interim arrangement for the provisional West German state. It was expected that an eventual reunification of Germany would adopt a proper constitution. On the other hand, the Grundgesetz and its amendments were never submitted to a popular vote, neither in 1949 nor at the reunification in 1990. In the current legal environment compliance means both following legal rules and regulations exactly as prescribed and meeting the regulation spirit even though the rules are not clear-cut. Failure to comply with the regulation may result in criticism, fines or penalties and possibly legal action.

(I₀₁₇) Amnesty = 57.4344

An accuse for avoiding responsibility after WWII was to hold people accountable for both war crimes and crimes against German people. The

authorities of the victorious powers acted after WWII in order to grant numerous individuals or groups of political prisoners a general amnesty. Dönhoff (Die Zeit, 2021, 19) supposed that the community of innocent Germans, who had been seduced under National Socialism, now had been treated hardly more bearable in the clutches of the victor's justice. Richard Tüngel, the Editor-in-chief of *Die Zeit* from 1946 to 1955 countered the victorious powers by saying: 'No' to the demand to confess to the guilt of war crime. The US General Lucius Dubignon Clay (*April 23, 1898 - April 16, 1978*) was a senior officer who was known for his administration of occupied Germany. His lenient denazification policies and grants of amnesty to almost 100,000 Nazis have been widely criticized since they were pardoned without trial.

(T₀₁₅) Political persecution = 51.8616

The act of WWII victors was during the first ten years an act of repression with the purpose to control the German population by force and particularly for the purpose of restricting or preventing the citizen's ability to take part in the political life of the society. Thereby, single individual's standing among fellow citizens is manifested through the policies that counter human rights. It was perfectly obvious that German's at that time had no rights. Their violations, surveillance, abuse, policy, brutality, imprisonment, involuntary settlement and stripping of citizen's rights, lustration and terror and other extra-judicial punishment of people believed to be Nazis were reinforced during the first ten years of the international occupation of German territories.

(T₀₄₃) Integration = -28.2219

After WWII, 12 million refugees and expellees came to Germany. They have provided examples of how one can integrate despite a country in tatters that had hardly the means to provide food for the newcomers. Human living conditions, work and social acceptance were the most important factors for integration. Post-war immigration had the advantage to contribute with skills and potential that had to be discovered and supported. All citizens should be able to participate on equal terms. The term 'integration' is addressing different groups having an exchange with each other. This means that everyone should be involved in societal affairs. The process of population enlargement was in the beginning used as a destabilising weapon but became later identified with the cooperation between local governments and a gradual harmonisation of different local laws.

(T₀₄₄) Enlargement = -52.0383

The reorganization of the European states after WWII required stable and democratic governments that respect the rule of law and its corresponding freedoms and institutions. By way of accessing a singular state, the 1991 established European Union (EU) had to enlarge itself by expanding the Union a number of times. The process of enlargement has implied the fulfilment of economic and political conditions. The most recent territorial enlargement came about in 2014. As of 2020, accession

negotiations are under way and have over time been described by various leaders of the EU.

(T₀₄₆) European identity = -85.3391

In the beginning of the 1950's, the phrase: 'Wir sind wieder wer' implied for the German people recovered self-esteem. In particular, the national coach Sepp Herberger of the football league did stand for the continuities and made the phrase: 'Wir sind wieder wer' with the 1954 World Cup, a gift to all Germans, who were only too happy to take it (Der Spiegel 1996, 52). The feasibility of a 'European identity' has been discussed parallel to the process of the enlargement of the European Union (EU). However, with the rise of (EU) scepticism and opposition to continued European integration, desirability of the development of a 'European identity' has been studied with the 'Eurobarometer surveys on identity' which has shown that European and national identities tend to add rather than to rule themselves out (Pan-European Identity, Wikipedia, 2021, July 11)

Structural Stability in the Intention Dimension

During text production, the A-component is responsible for the angular articulation of intention. Since articulation is assumed to be functional, it is causing text elements to rotate with their own specific displacement dynamics. At the locations where movements originate, patterns can vary greatly with respect to their formation as well as their degrees of rotation. Since the focus is on the magnitudes of rotation as a means to establish the structural stability of the A-component, changes in the integration of the magnitudes of the A-function have to be processed and made manifest in the evolving intention space. The discovery of the magnitudes of intentional text dynamics, causing a discourse to vary, implies the clocking mode of the derived [AaO] units. But the articulation of intention is not always known to the articulator or made explicit by the text producer.

The aim with the present paragraph is to show that the magnitudes of articulation can be produced without retreat to the concept of consciousness and its description. To be sure, this is a first step toward a longitudinal study of the laws governing the dynamics of the A-component. Hence, in approaching intention on the basis of the A-component, discontinuity in text building behaviour can be observed and made the foundation for the lawful relations, assumed to exist between intention and text production.

From an experimental point of view, it means that the A-function is constitutional for the production of rotational movement patterns as well as for the development of open spaces. The theoretical significance of open spaces relates to dummies [Ø] and to the determination of evolving attractions and the way in which the attractions restrict the channelling of the produced articulations. This fact may be conceived of as a rigorous basis for an unambiguous and definite test of the validity of the intention space.

A successful transformation of the abstraction process provides for

8 Reparation of German Self-esteem

the step that requires the proper extraction of the termini for the description of the A-component which can designate the nodes of the A-mesh. It is worthwhile to remember that the AaO axiom stipulates that the *Agent must get its description through the Objective*, an axiom which has been validated empirically by the manifestation of Table A2 and Figure 2.

(T_{A38}) *Credibility* = 110.0961

Establishing German "Credibility" after the Second World War needs to be conceived as the first criterion that must be fulfilled if trustworthiness shall be gained by the Germans after the war. This is the condition that is essential for achieving respectability on the international scene. Clearly, linking this aspect with the German reality will demonstrate behavioural trustworthiness. According to a general observation and experience, Germans tend to put emphasis on the fundamentals of trust. People believe in institutions, generally obey rules and adhere to norms and standards. Germany is a country with a strong rule of law and low level of corruption. People act rationally and make trust judgements.

(T_{A36}) *Longevity* = 92.9181

Longevity, defined as a long duration of life, is the result of a decrease in cumulative mortality. The trend toward increasing survival into old ages has come about as a result of decreasing mortality rates for people of older age. Improvements in environmental hygiene and social welfare have contributed to current life expectancy trends. A number of studies point toward longevity as the result of two major factors, namely genetics and lifestyle choices. The compression of morbidity seems to be the result of extrinsic life qualities as well as intrinsic genetic advantages.

(T_{A34}) *Nürnberg Processes* = 82.9230

On September 30, 1946, the International Military Tribunal (IMT) pronounced its judgment in a document of 50,000 words on the German personalities and organisations charged before it. For the first time in history, the victorious leaders of WWII tried the German leaders for responsibility. The IMT has declared in its judgment "To initiate a war of aggression is not only an international crime; it is the supreme international crime, differing only from other war crimes in that it contains within itself the accumulated evil of the whole."

First and best known is the categorization of the crimes and the constitution of the court which represented a juridical advance that was expected to be followed by the United Nations. For the first time in international law, indictment was directed toward genocide and war crimes as well as extermination of racial and national groups (Wikipedia. the free Encyclopaedia. 2020, September).

(T_{A32}) *Justice* = 76.6178

"The Grave Responsibility of Justice" is the title of Justice Robert H. Jackson's opening statement at the Nuremberg Trials. It remains one of

the most famous and influential oratories in the canon of international law and criminal jurisprudence, November 20, 2020. 'For more than three hours, Jackson relentlessly made his argument, condemning the Nazi regime and its actions as criminal from the very moment of their inception to the arrival of their defeat.

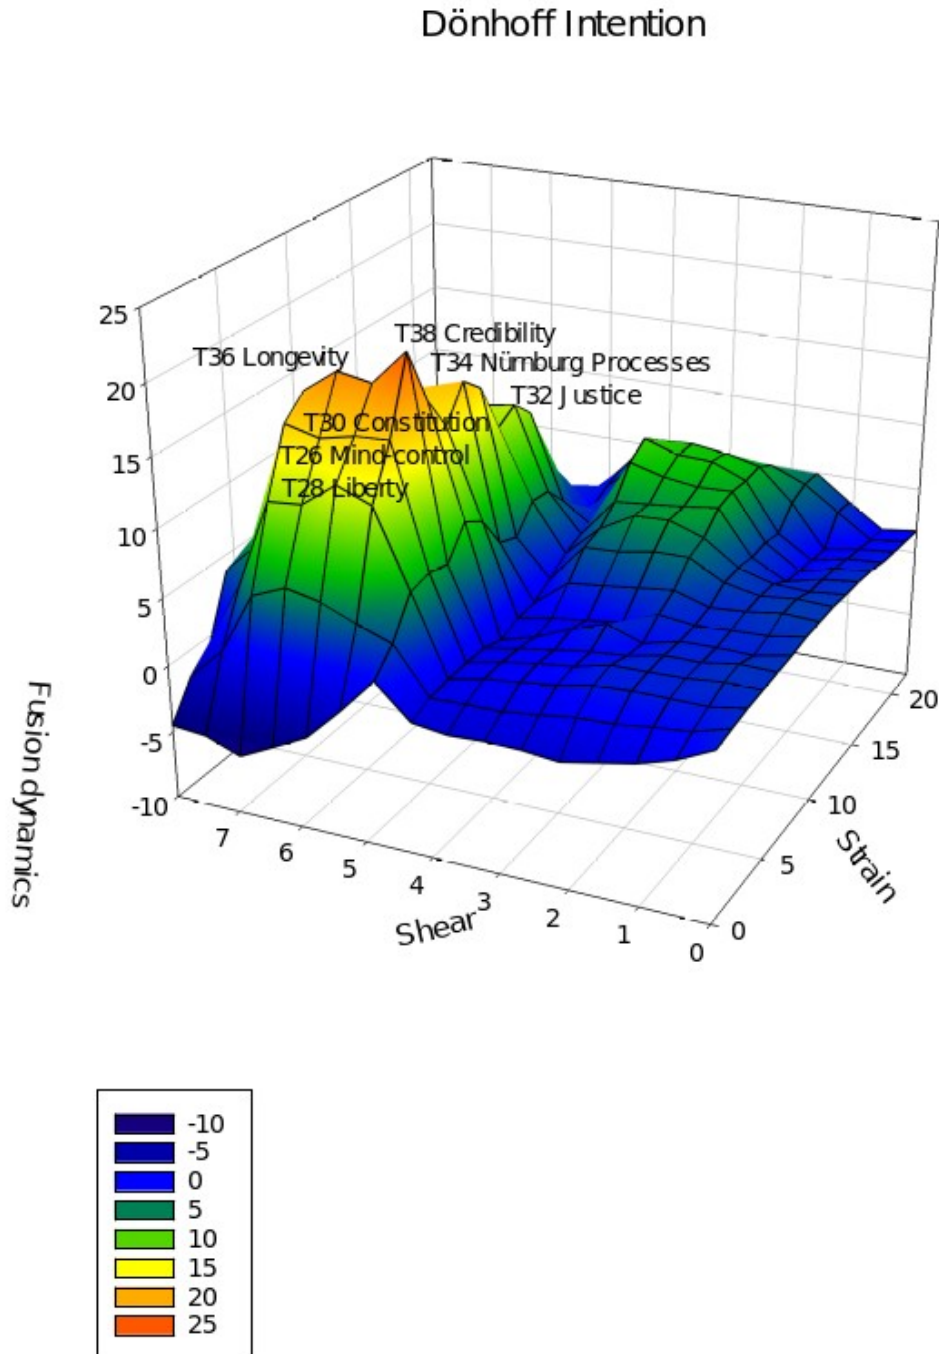

Figure 2 *Intention graph derived from the Dönhoff paragraph. Die Zeit, 2021, No. 19)*

Albert Speer, the Nazi Minister of Armaments and War Production, was both impressed by Jackson's "grand, devastating address", but also comforted somewhat "from one sentence in it which accused the defendants of guilt for the regime's crimes, but not the German people."

© 2023 by Bernhard Bierschenk
All rights reserved.

At the conclusion of his statement, Jackson was honest in his assessment of human history, but also hopeful in his appraisal for humanity's future'. With many differing viewpoints and perspectives, concepts of moral correctness, based on ethics, are influencing justice acted out by the operating international court and the enforcement of international ruling. However, the response to the 'Nürnberg Trials' was controversial. Many people were of the opinion that the trials favoured justice to the extent that human rights violations were punished. But others did respond critically because the law was imposed retroactive upon the accused Nazis.

(T_{A30}) Basic Law (Constitution) = 70.2718

The Basic Law was approved in Bonn on 8 May 1949. It came into effect on 23 May after having been approved on 12 May by the occupying Western Allied forces. It was provisional and as Grundgesetz awaiting approval by the parliament of Germany as a whole. Its radical humanism includes the most fundamental rights that determine the way society is organised in Germany. No other law may contradict the Basic Law which may be seen as a response to the experiences with the Nazis. The clear and concise message of the Law is that human dignity is inviolable. The Federal Constitutional Court is in charge of monitoring and assuring compliance with the Basic Law. The government cannot simply amend the Basic Law.

(T_{A26}) Mind-control = 54.34

Mind-control is also known as manipulation, and the fact that there are many different names for this phenomenon indicates a lack of agreement. How to change people's beliefs and behaviours refers to the concept of mind-control. It implies a system of influences that significantly disrupts thinking at its singular core. A combination of words and group pressure may create dependency. The person being mind-controlled is not aware of the influence process or of the changes occurring because of the applied operation.

(T_{A28}) Liberty = 53.0938

Freedom from external restraints and the ability to do as one pleases is at the core of this attractor. It is a synonym for being free within society from oppressive restrictions. It involves free will and the responsible use of freedom under the rule of law. This definition works for both freedom under natural law and freedom under civil law. Freedom under law means that all are subject to the same laws. Though, defining equality before the law in particular cases is difficult because judges in all countries believe to have a standing rule to be applied to everyone in society who can pursue happiness unconstrained, except by just equal and impartial laws, operating on all alike.

Discussion

The aim with the naming procedures is to explain the attractors of the Free Energy Surfaces (FES). As demonstrated an FES consists of nothing but a geometric pattern of mountains and valleys, i.e. the abstract configuration of attractors. However, if it shall be possible to orient oneself in this Energy Landscape (EL), it must be possible to transit the terminal states of EL and to manifest the results in the form of a transformation path. It follows that this operation must become recognisable in the form of termini. Since a terminus is the result of a transformation process, it incorporates both the state as well as the dependency relation between termini. A detailed description of the transformational steps involved in a sequence of attractors allows for a thoroughly controlled naming process. Further the terminologically controlled state-changes are expected to lead to the correct communication of ecologically significant information invariants.

Thus, transition through an energy landscape is strictly controlled by the underlying attractor relations. Since the integration process exists only over time, it is generating the termini and is also correcting itself. Repeated transformations and crossing of one path with another allows for the integration of the consequences of having found the function in the form of structural relations. Thus, shifting experiences are provided during the naming, which is expected to lead to an understanding of the meaning of the transformation function.

The Determination of State Attractors In phase-dependent measurements, at least one isolated phase singularity may arise in a simultaneously evolving state space and constitute the source for the naming of the emergent singularity. When a singularity is conceived of as a state attractor, which is forming at a certain given point in time, the attractor may be defined as the local concentration of conserved information. Therefore, a relation in a state space must incorporate both the state and the dependency relation between attractors. Hence, named relations make apparent that irreversible processes appear as constraints at the kinematic level. Their determination is dependent on the making and breaking of symmetries.

When a language space makes up the context, cooperation between intention and orientation is no longer the objective of the physical conditions of making experience. Instead, it is the hyperbolic determination of regional and global state attractors. Thereby, new constraints are produced which pass beyond the limit of their material sources. Therefore, state attractors are evolving in workspaces, which have the hyperbolic property of intrinsic as well as extrinsic curvature (Wisdom, 2003). Hence, state attractors are organising themselves in hyperbolic spaces which are negatively curved. By definition, negatively curved spaces are hyperbolic at any level and require that ordinary geometry is replaced with what has become known as non-commutative geometry (Connes, 1994 p. 7; Greene, 1999, pp. 379-380; Hestenes, 1994, p. 66).
